

Designing

Here at capital draughting we can undertake all design work that needs engineers calculations, from ring beams, 50 meters of steel balustrading, steel connections, new dwellings, industrial units, etc, You will find the details very practical and at extremely competitive rates.

Our fully qualified engineer issues a complete set of calculations with all jobs for approval, and on full completion weather being building regulations or moment connections on a steel portafame.

We like to work with the client when design to achieve the best possible resolution by using thier input and skills to produce the most efficient results. All engineering work is to British standards.

As you probably now know we specialize in steel draughting here and we can design the steel structure right from the word go. Section sizes, required building dimensions, all can be done in our planning permission and building regulations department and the job carried through to the structural steel department, this way we have a head start on the design and what is required of us to produce. We can even get you a rough price for the supply and fit of any steel too.

An engineers input to any job weather it being building regulations or steel work is an important part of the works, so having a good working relationship with a good engineer goes along way in this business.

Our engineer and building surveyor are sub contractors with 30 years experience, so all engineering and building regulation prices are + VAT. This has two advantages, firstly it keeps the prices low because they have to compete for everything, and secondly you still get the complete package under one company, so let us get you the best prices by doing all the chasing around in the engineering and building regulations field.

For more information or quotations on the above. Please feel free to give us a call on 01245 495 822 or email us here.
